

HTML Structure Revision

Root Element

is the root element that contains the entire HTML document.

Parent/Child/Siblings

Parent contains child elements; children inside parent; siblings share the same parent.

Container Elements

Elements like div, section, article, main group related content.

Semantic Elements

header, nav, main, section, article, aside, footer describe meaning.

Non-Semantic Elements

div and span are generic containers without meaning.

Attributes

Extra information such as id, class, href, src, alt, title.

Block-level Elements

Usually start on a new line and occupy available width (div, p, h1, section, article, form).

Inline Elements

Stay on the same line and occupy only required width (span, a, strong, em, label).

Table Note

starts on a new line but its default CSS display is 'table', not 'block'. tr uses table-row and td uses table-cell.

Void Elements

img, br, hr, input, meta, link have no closing tag.

Nesting

Place elements correctly inside one another and close them in the proper order.

id vs class

id is unique; class can be reused on multiple elements.
